Danger Level 4 - High

Treeline

Tendency: Decreasing avalanche danger
on Saturday 28 March 2026

New snow

Treeline

Snowpack stability: very poor
Frequency: many
Avalanche size: large

Persistent weak layer

2200m

Snowpack stability: very poor
Frequency: some
Avalanche size: large

Gliding snow

2400m

For those venturing off piste a dangerous avalanche situation will be encountered over a wide area.

The large quantity of fresh snow and the sometimes large wind slabs that are forming in all aspects can be released easily or naturally above the tree line. Avalanches can be triggered in near-surface layers and reach large size in isolated cases. Additionally in some places avalanches can penetrate near-ground layers of the snowpack and reach large size on west, north and east facing slopes, especially above approximately 2200 m. Remotely triggered avalanches are possible.
The danger exists primarily in alpine snow sports terrain.

In addition gliding avalanches are possible, especially on cut and grassy slopes below approximately 2400 m.

Snowpack

Danger patterns dp.6: cold, loose snow and wind | dp.1: deep persistent weak layer

40 to 60 cm of snow, and even more in some localities, has fallen since Wednesday. Up to 15 cm of snow will fall in the next few hours.
The wind will be strong. The wind will transport the new snow significantly. Further wind slabs will form.

The new snow and wind slabs are lying on the unfavourable surface of an old snowpack above the tree line. The old snowpack will be weakly bonded, especially on west, north and east facing slopes above approximately 2200 m, and on south facing slopes in high Alpine regions.

Tendency

Avalanches can as before be released easily. Restraint is advisable on this first sunny day.
