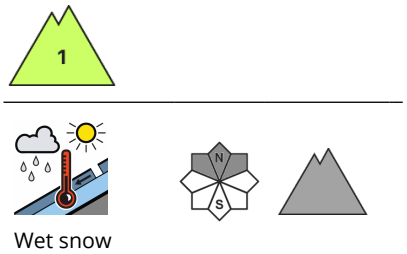
Danger Level 1 - Low



Individual avalanche prone locations

The avalanche risk is low. Wet snow can be problematic in rare cases. Occasionally, on very to extremely steep slopes with sufficient snow, wet loose snow avalanches or wet gliding avalanches on slippery ground can release themselves. Avalanches usually remain small.

Snowpack

The remaining snowpack is widely patchy and completely soaked. The southern sides are largely free of snow except for individual snow fields in areas adjacent to the ridgeline, crest or summit.

Tendency

No change
