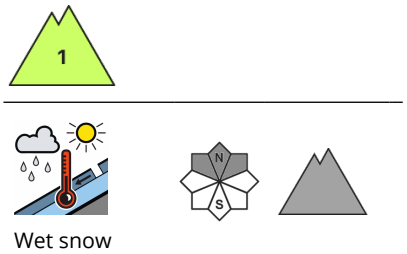
Danger Level 1 - Low



Be aware of the risk of being swept away by small avalanches in terrain where there is a danger of falling.

The avalanche risk is low. Wet snow can be problematic in rare cases. Occasionally, on very steep slopes with sufficient snow, wet loose snow avalanches or wet gliding avalanches on slippery ground can release themselves. Avalanches usually remain small.

Snowpack

The remaining snowpack is widely patchy, consists of snowmelt and is completely soaked. The southern sides are largely free of snow except for individual snowfields in areas adjacent to the ridgeline, crest or summit.

Tendency

The avalanche danger remains low.
