Danger Level 1 - Low

The southern sides are largely covered in snow.

The avalanche risk is low. On the northern sides of the highest peaks and areas adjacent to the summit and ridge, older snowdrift accumulations with low additional loads can be triggered as small slab avalanches.

Snowpack

Older wind slab snow has usually bonded well with the old snow surface. In the highest areas adjacent to the ridgeline, crest or summit, it can still be prone to triggering on shady slopes. The snowpack is generally well stabilised and slightly moist. The snow is still powdery on the surface on steep north-facing slopes at higher altitudes. Overall there is little snow, the south-facing slopes are largely snowed out.

Tendency

The avalanche danger does not change.
