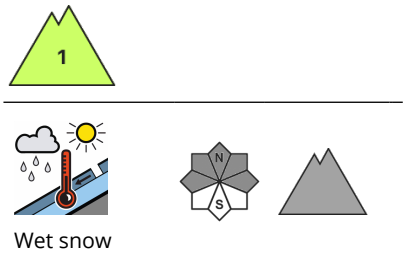
Danger Level 1 - Low



Increasing deaperisation

The avalanche risk is low. Wet snow is the problem. In extremely steep terrain, occasional wet loose snow avalanches and on steep slopes with smooth ground, wet gliding avalanches can release themselves. Avalanche activity is limited to terrain on shady slopes where there is still snow. Wet avalanches usually remain small.

Snowpack

An overcast sky and temperatures well above zero ensure that the remaining snowpack continues to soak. It consists mainly of snowmelt. The southern sides are largely snowed out.

Tendency

The avalanche danger remains low.
