Danger Level 1 - Low

Risk of snagging and falling due to small snowdrift accumulations.

The avalanche danger is low. Snowdrift accumulations in steep, blown-in areas can be triggered in some places by a small additional load as a small snow slab.

Snowpack

Small, older snowdrift accumulations lie on surface hoar or graupel in some places. Below the melt-freeze crust near the surface, faceted crystals can be found at higher elevations down to the ground. There is little snow on the south side.

Tendency

No significant change until the weather changes on Thursday.
