

Danger Level 3 - Considerable

Tendency: Constant avalanche danger
on Saturday 31 January 2026

Snowpack stability: poor
Frequency: some
Avalanche size: medium

Wind slabs and weakly bonded old snow represent the main danger.

Fresh and somewhat older wind slabs are prone to triggering above the tree line. These are covered with new snow in some cases and therefore difficult to recognise. Avalanches can in some places be released, even by a single winter sport participant and reach medium size. Avalanche prone locations are to be found in particular on steep west, north and east facing slopes. Caution is to be exercised in particular in gullies and bowls, and behind abrupt changes in the terrain, as well as on wind-loaded slopes.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.5: snowfall after a long period of cold

10 to 20 cm of snow has fallen.

The new snow and wind slabs are lying on top of a weakly bonded old snowpack. The old snowpack consists of faceted crystals.

Tendency

Hardly any decrease in danger.
