

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 2 January 2026

**Low avalanche danger will prevail. Fresh wind slabs require caution.**

The fresh wind slabs are small. Very isolated avalanche prone locations are to be found on very steep shady slopes at elevated altitudes and adjacent to ridgelines.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

Little snow has fallen. This applies in the north and in the northeast. The wind will be strong in some regions.

The old snowpack is faceted, especially on west, north and east facing slopes at elevated altitudes.

The snowpack will be subject to considerable local variations. Less snow than usual is lying in all altitude zones.

### Tendency

Low avalanche danger will prevail. Fresh wind slabs require caution.
