### Danger Level 1 - Low

Risk of snagging and falling due to small snowdrift accumulations.

The avalanche danger is low. Snowdrift accumulations in steep, blown-in areas can occasionally be triggered as a small slab by a small additional load.

### Snowpack

Small, older snowdrift accumulations lie on surface hoar in some places. Below the melt-freeze crust near the surface, faceted crystals can be found at higher elevations down to the ground. There is little snow on the south side.

### Tendency

With stronger winds and new fallen snow, the wind slab problem will increase from Wednesday evening.
