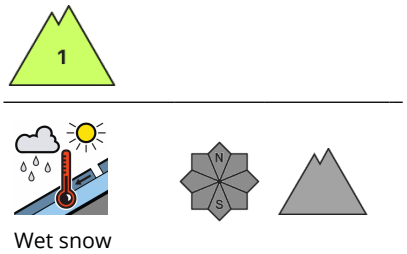
Danger Level 1 - Low



Rain continues to melt the snowpack.

The avalanche risk is low. Wet snow is the problem. In extremely steep terrain, wet loose snow avalanches and on steep slopes with smooth ground, wet gliding avalanches can release themselves. Wet avalanches usually remain small.

Snowpack

The outgoing longwave radiation at night is severely limited and a stable melt-freeze crust can hardly form. The precipitation falls widely as rain and ensures additional soaking of the partly wet snowpack.

Tendency

No change in avalanche danger
